Executive Summary

This report presents the findings of a comprehensive security audit conducted at Mita School, a training center focused on technology skills development located at Ekpeyoung street Uyo, Akwa Ibom State. The audit was designed to evaluate the organization's current security posture, assess compliance with relevant data protection regulations, identify potential vulnerabilities, and propose actionable measures to mitigate risks. The findings reveal that, although Mita School has made commendable progress in implementing fundamental security measures, there remain significant gaps in its policies, technical controls, and administrative safeguards that could expose the institution to cybersecurity threats.

Scope

The audit encompassed the following areas:

- Review of organizational security policies and guidelines.
- Assessment of technical infrastructure security, including networks, systems, and software.
- Evaluation of staff compliance with cybersecurity best practices.

Objectives

The objectives of the audit were as follows:

1. To identify internal and external threats to the institution.
2. To evaluate the effectiveness of existing security controls.
3. To provide recommendations for strengthening the security framework.

Risk Assessment

During the audit, several vulnerabilities were observed: weak password policies among students and some staff members, leaving devices susceptible to brute-force attacks; unsecured Wi-Fi networks; the absence of multi-factor authentication; and a lack of access cards for students tied to specific courses. Additionally, the current system permits students to attend classes for which they are not enrolled, a practice that could be exploited to gain access to multiple courses while paying for only one.

Controls Assessment

At present, student movement within the institution is somewhat restricted, and staff areas are not easily accessible to students. Attendance records are maintained to monitor check-ins and check-outs, and workplace cleanliness standards are observed. These represent some of the administrative and physical controls in place.

However, the installation of closed-circuit television (CCTV) systems is strongly recommended to enhance monitoring capabilities. On the technical side, the institution offers free Wi-Fi access for staff and students to facilitate academic activities, and a 24/7 power supply supports these operations. These constitute the primary technical controls currently implemented.

Risk Mitigation Recommendations

1. CCTV Installation: Deploying CCTV cameras will facilitate effective monitoring of both student and staff activities. This measure will also assist in the recovery of misplaced or stolen items within the institution.
2. Wi-Fi Management: While the school's Wi-Fi should remain operational at all times, access should be restricted to academic-related websites via a proxy server to prevent unauthorized usage by individuals without study-related intentions.
3. Access Control Systems: Introduce access cards for all students, staff, and ancillary personnel. Implement technology capable of authenticating these cards to grant entry. This will deter unauthorized individuals from accessing lecture rooms and will eliminate the need for manual attendance registers.
4. Class Access Restrictions: Student access should be limited strictly to the courses for which they have paid. Exceptions may be made under extenuating circumstances (e.g., inclement weather) where cross-class attendance might be unavoidable.

Communicating the Results

Mita School exhibits a commitment to fostering a secure learning environment. Nonetheless, critical gaps demand prompt remediation to avert potential security breaches and ensure adherence to data protection legislation. By implementing the recommendations outlined in this report, the school can significantly enhance its cybersecurity posture and operational integrity.
